

# FileWalker

Travis Build Status for Master Branch: [<a href="https://travis-ci.org/jnorthr/FileWalker">>Build Status \(Travis CI\)</a></a>](https://travis-ci.org/jnorthr/FileWalker)

Revised to use gradle version 7.1 and later versions of groovy,etc

## Purpose

A Gradle project for Groovy users who need utility code to walk a local directory. Clone includes gradle build tool wrapper and folder structure like maven/gradle so you don't need an installed gradle build tool.

### *Pre-requisite*

1. Working internet connection
2. Installed Git client to copy/clone this repo
3. Ability to use terminal console

### *Steps*

1. Open terminal console
2. Change directory \ ( cd \ ) into target folder location
3. Run this command to create a folder and copy down all the pieces :

```
git clone https://github.com/jnorthr/FileWalker.git
```

4. **cd FileWalker/**
5. **./gradlew** runs a series of defined tasks to build and test code samples
6. After prior step completes, examine **FileWalker/** folder to find the **/build/** folder with test results

**.travis.yml** needed extra logic to be able to push to github repo and have Travis C/I testing work as expected.
